Bioproducts and Biosystems Engineering

Sustainable Use of Renewable Resources – Enhancement of the Environment

**Atmospheric  
deposition**

**Human food**

**Animal feed**

**Inputs**

**Fertilizer**

**Sewage  
effluent**

**Solid waste &  
biosolids**

**Animal  
products**

**Retention  
(soil P)**

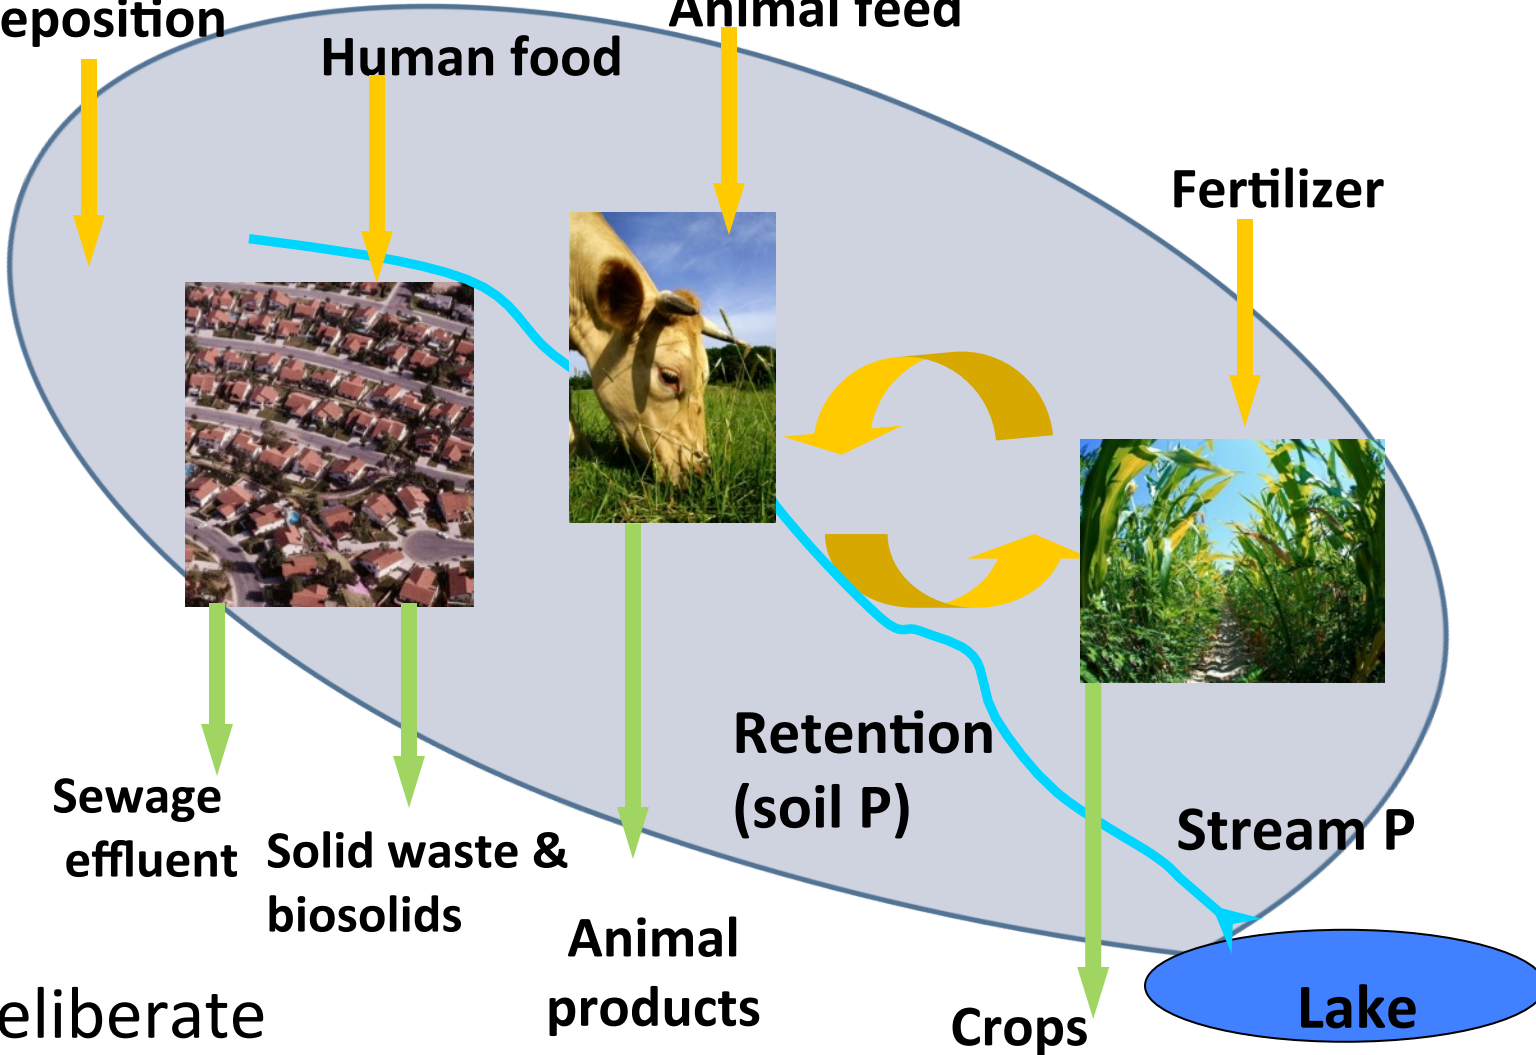

**Stream P**

**Deliberate  
Exports**

**Crops**

**Lake**

**The Whole Watershed P Balance Concept**

# The promise of whole-watershed P balances

1. **Current approaches, which often rely on trapping P at the end of the pipe/field, are not working on a large scale.**  
*A wealth of science suggests that creating a negative P balance would likely reduce stream P.*
2. **Constructed BMPs are expensive.**  
*The P balance approach leads to lower P use, potentially saving money.*
3. **The TMDL approach is expensive and confusing.**  
*The P balance approach is conceptually simple and intuitive.*

### Annual Total Phosphorus Load

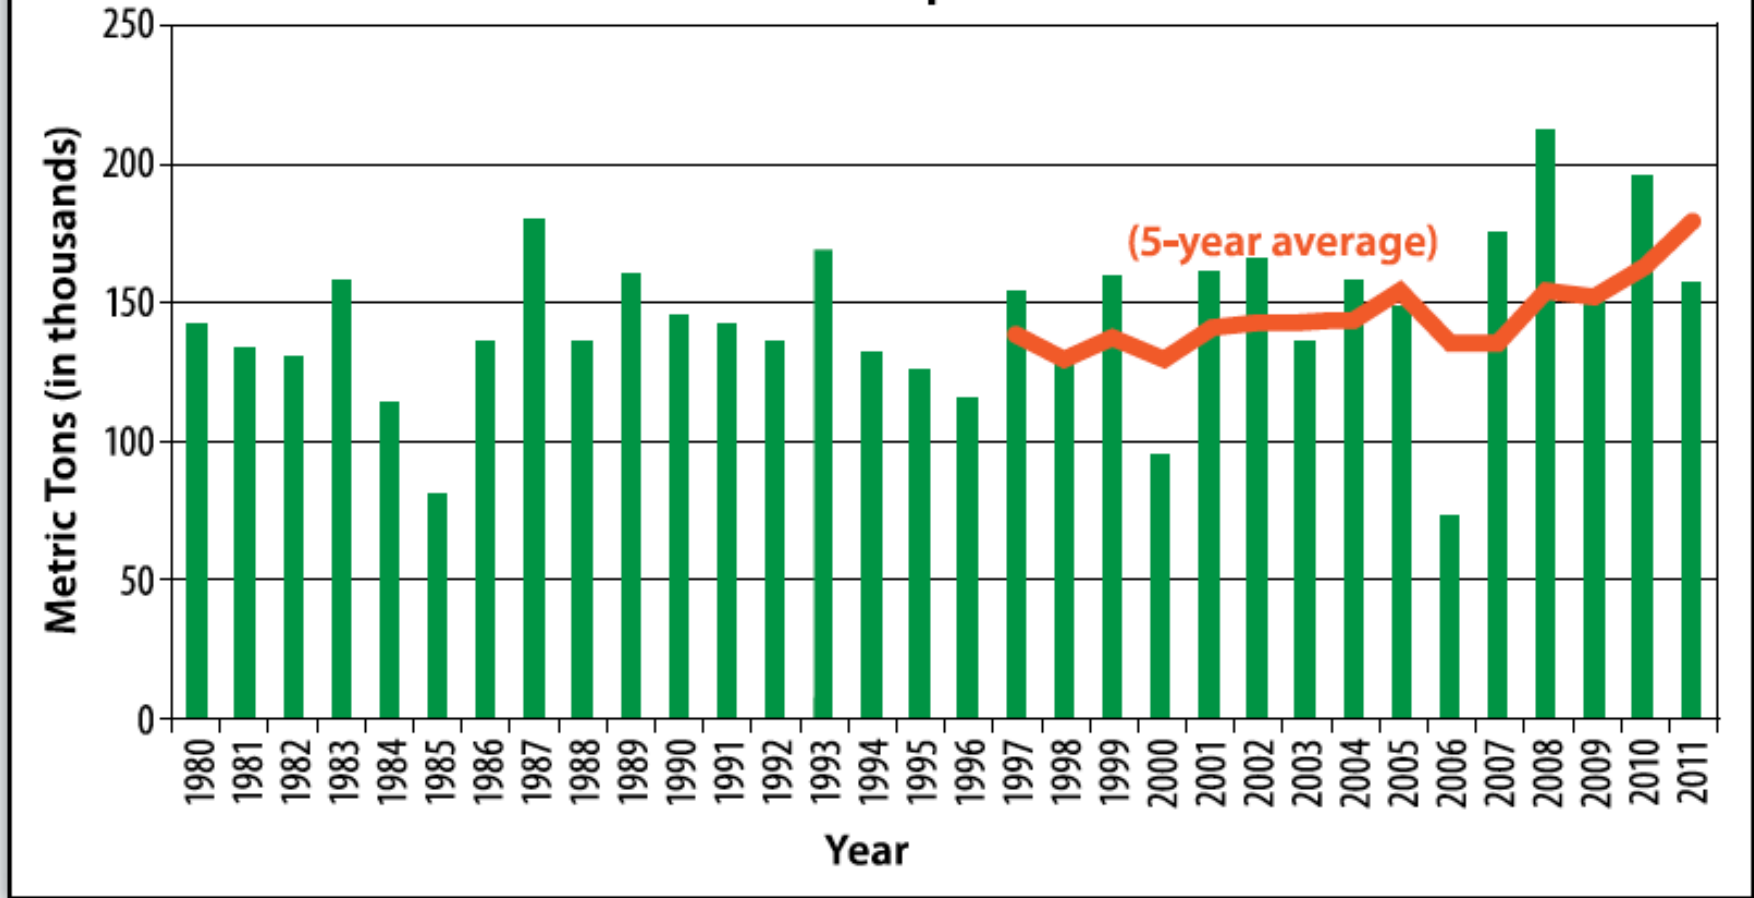

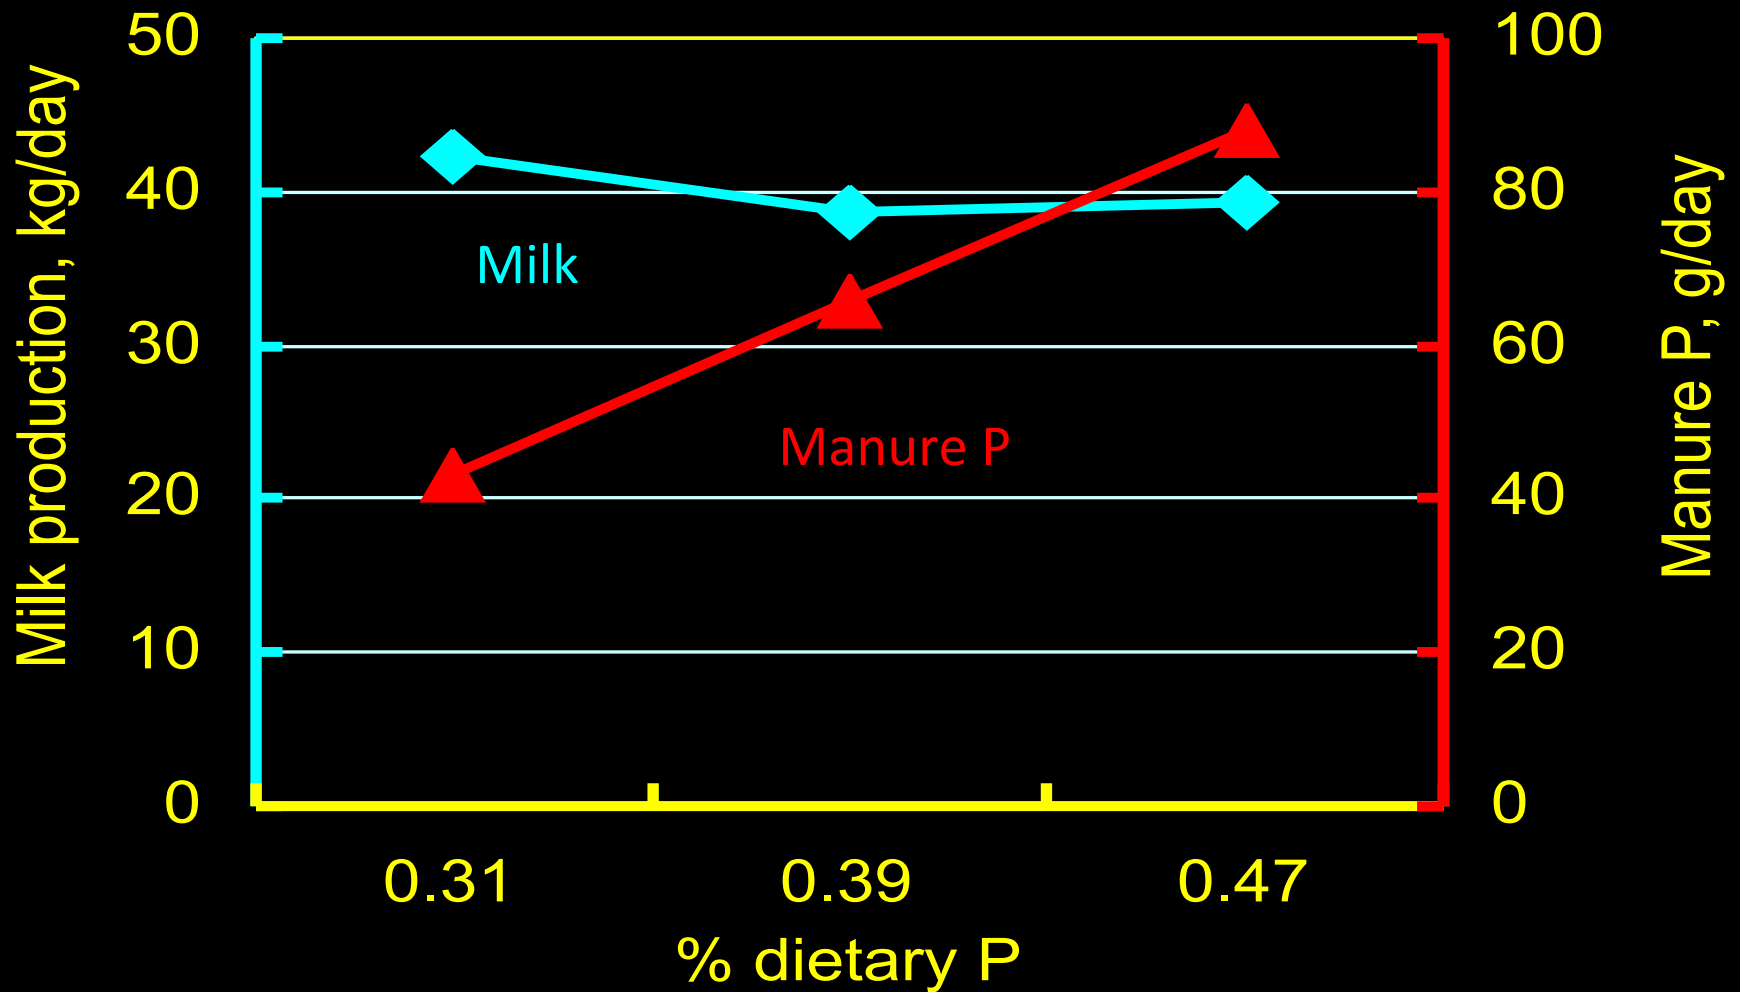

Figure 3. Annual TP loads to the Gulf of Mexico.

Point #1: Current approach for reducing NPS P pollution have not worked very well.

*Point #2 (cost): Study of P supplements in dairies showed overuse of P supplements (Wu et al. 2001, J. Dairy Sci.)*

| BMP |  |  |
|-----|--|--|
|     |  |  |
|     |  |  |
|     |  |  |
|     |  |  |

Add this slide on BMP costs – from CRWSD

# Goal: Develop a Watershed P Balance Tool To Inform Nutrient Reduction Plans

1. Develop watershed-specific P balance with sufficient detail to be *actionable*.
2. Develop spreadsheet tool to support general use.

## Albert Lea Lake Watershed

- 164 square miles
- 64% cropland
- City of Albert Lea

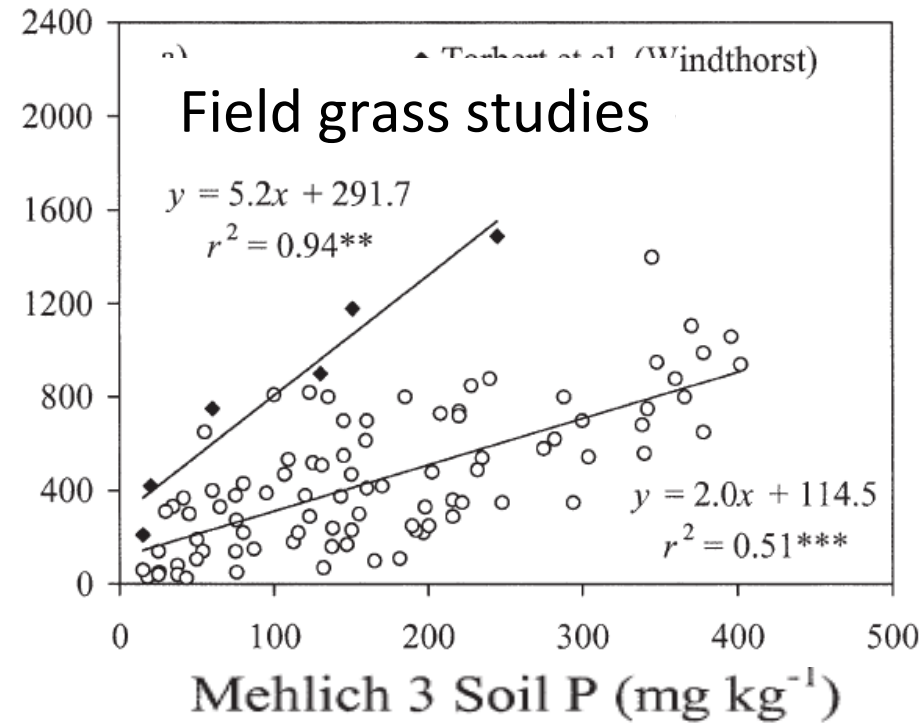

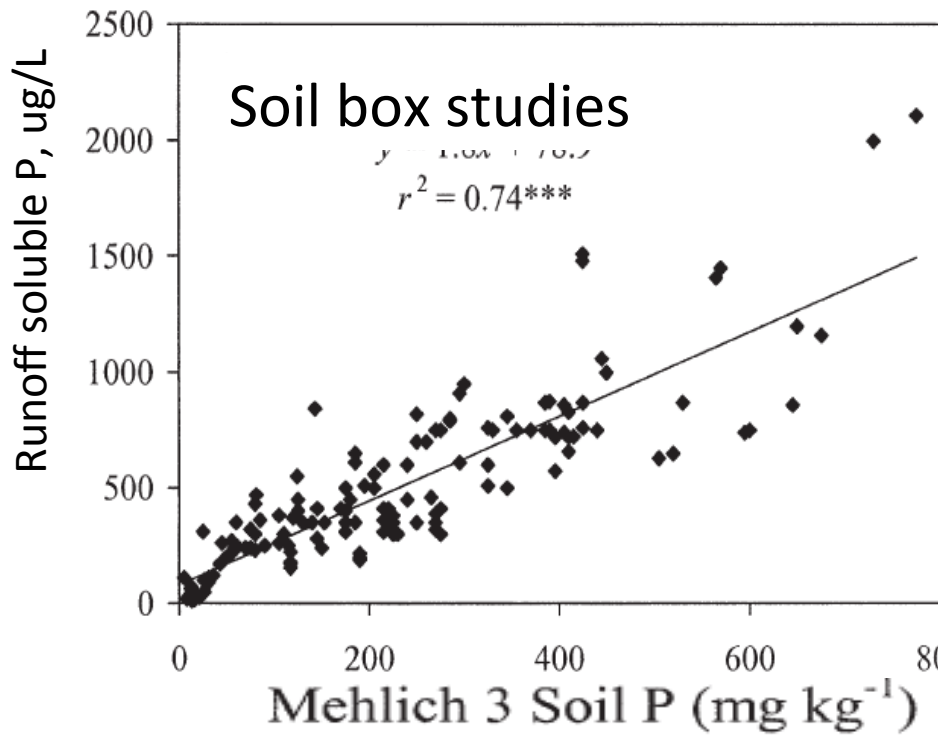

# Relationship between watershed P balance and stream P

P inputs > Deliberate P export:  
Soil test P (STP) increases  
Stream P increases

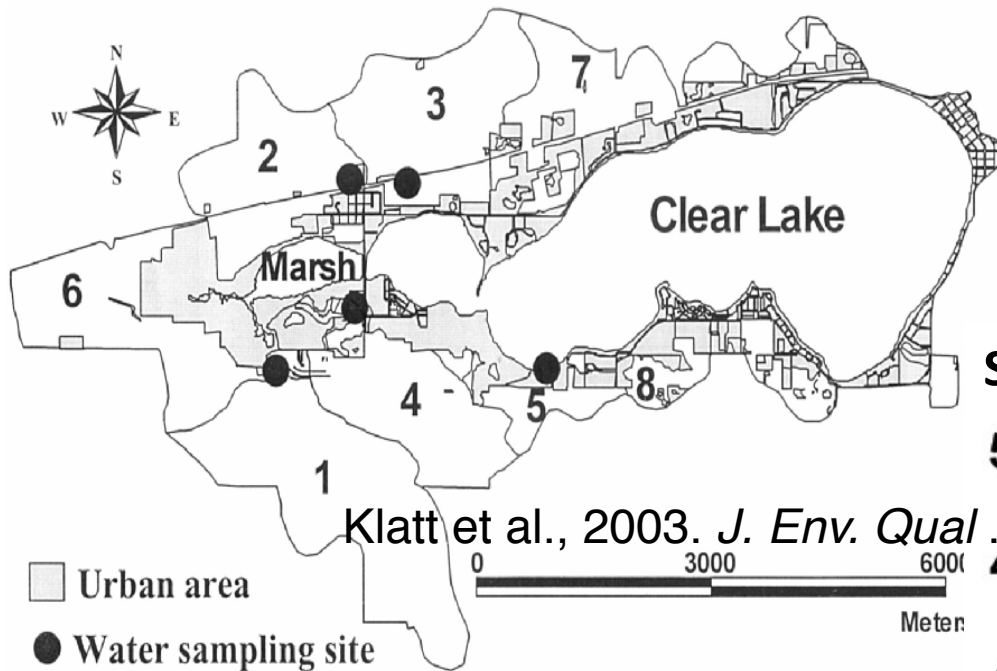

P inputs < Deliberate P export:  
STP decreases  
Stream P decreases

*Is this true?*

*Runoff P is predicted from STP (Mehlich 3 P) in lab “soil box” studies (left) and in field grass studies (right). (Vadas et al., 2005, J. Env. Qual.)*

Stream P, ug/L

2. For watersheds, stream P concentrations is related to average STP (Klatt et al., 2003, *J. Env. Qual.*)

- Big Trout
- Sibley
- Long
- Belle Taine
- Gilbert
- Le Homme Dieu
- Fishhook
- Darling
- Lobster
- Victoria

% input P

2. Understand the fate of input P to watersheds (Schussler et al. 2007).

3. Understand temporal watershed P dynamics  
 (Randall et al., 1997, *J. Ag. Production*)

# Approach for Albert Lea Watershed P Balance

Crop cover in 2010

Soybeans (39%) 

Corn (56%) 

# Albert Lea Lake watershed crop data

|            | Fertilizer application per acre   |     | Land area fertilized |         | Calculated total P crop uptake‡ | Calculated total P applied |
|------------|-----------------------------------|-----|----------------------|---------|---------------------------------|----------------------------|
|            | lbs P <sub>2</sub> O <sub>5</sub> | lbs | %                    | (acre)† | (tons)                          | (tons)                     |

†Area calculated using the USDA, 2010 Cropland data layer.

‡Based on %P dry-matter values from Ketterings and Czymmek (2007).

*Crop data were determined from 88 on-farm interviews (Denton Bruening) + NASS data.*

# Adjusted Number of Animal Units

(Denton Bruening and Colin Whitmer)

| <b>Livestock System</b> | <b>Permitted</b> | <b>Actual</b> | <b>% of Permitted</b> |
|-------------------------|------------------|---------------|-----------------------|
| Beef                    | 2,223            | 829           | 37%                   |
| Dairy                   | 218              | 218           | 100%                  |
| Horses                  | 245              | 43            | 18%                   |
| Sheep                   | 398              | 95            | 24%                   |
| Swine                   | 12,824           | 6,157         | 48%                   |
| Turkey                  | 445              | 440           | 99%                   |
| Multi-Animal            | 434              | 98            | 23%                   |
| <b>Watershed Total</b>  | <b>16,787</b>    | <b>7,880</b>  | <b>47%</b>            |

*Visual inspection showed that actual animal counts were lower than permit values.*

# P Flow through MN Swine System

| Stage  | Count      | Feed<br>P   | Manure<br>P | Output P (Gg/Yr) |               |
|--------|------------|-------------|-------------|------------------|---------------|
|        |            | ---Gg/Yr--- |             |                  |               |
| Piglet | 10,800,000 | 3.2         | 1.4         | 8.1              | Pork Produced |
| Feeder | 10,800,000 | 12.2        | 5.6         | 0.3              | Rendered      |
| Sow    | 306,000    | 1.6         | 1.3         | 0.2              | Composted     |
| Gilt   | 291,000    | 1.4         | 0.6         |                  |               |
| Boar   | 2,150      | .008        | .007        |                  |               |

# Swine P Balance (tons/yr)

Meat = 48.4

Piglets = 5.2

Rendered  
= 1.5

Manure = 38.5

Feed = 85.0

---

Output: 88.4 ton P / yr

---

Input: 90.2 ton P / yr

*We developed P balances for each animal system.*

# Summary of Calculated Livestock Efficiencies

| <b>System</b> | <b>Input</b> | <b>Manure</b>    | <b>Product</b> | <b>Export</b> | <b>Efficiency</b> |
|---------------|--------------|------------------|----------------|---------------|-------------------|
|               |              | <i>(tons/yr)</i> |                |               |                   |
| Beef          | 18.1*        | 14.3             | 5.0            | 28%           |                   |
| Pork          | 90.2         | 38.5             | 49.9           | 55%           |                   |
| Dairy         | 3.6*         | 2.4              | 1.3            | 37%           |                   |
| Turkey        | 22.7*        | 11               | 12.4           | 54%           |                   |

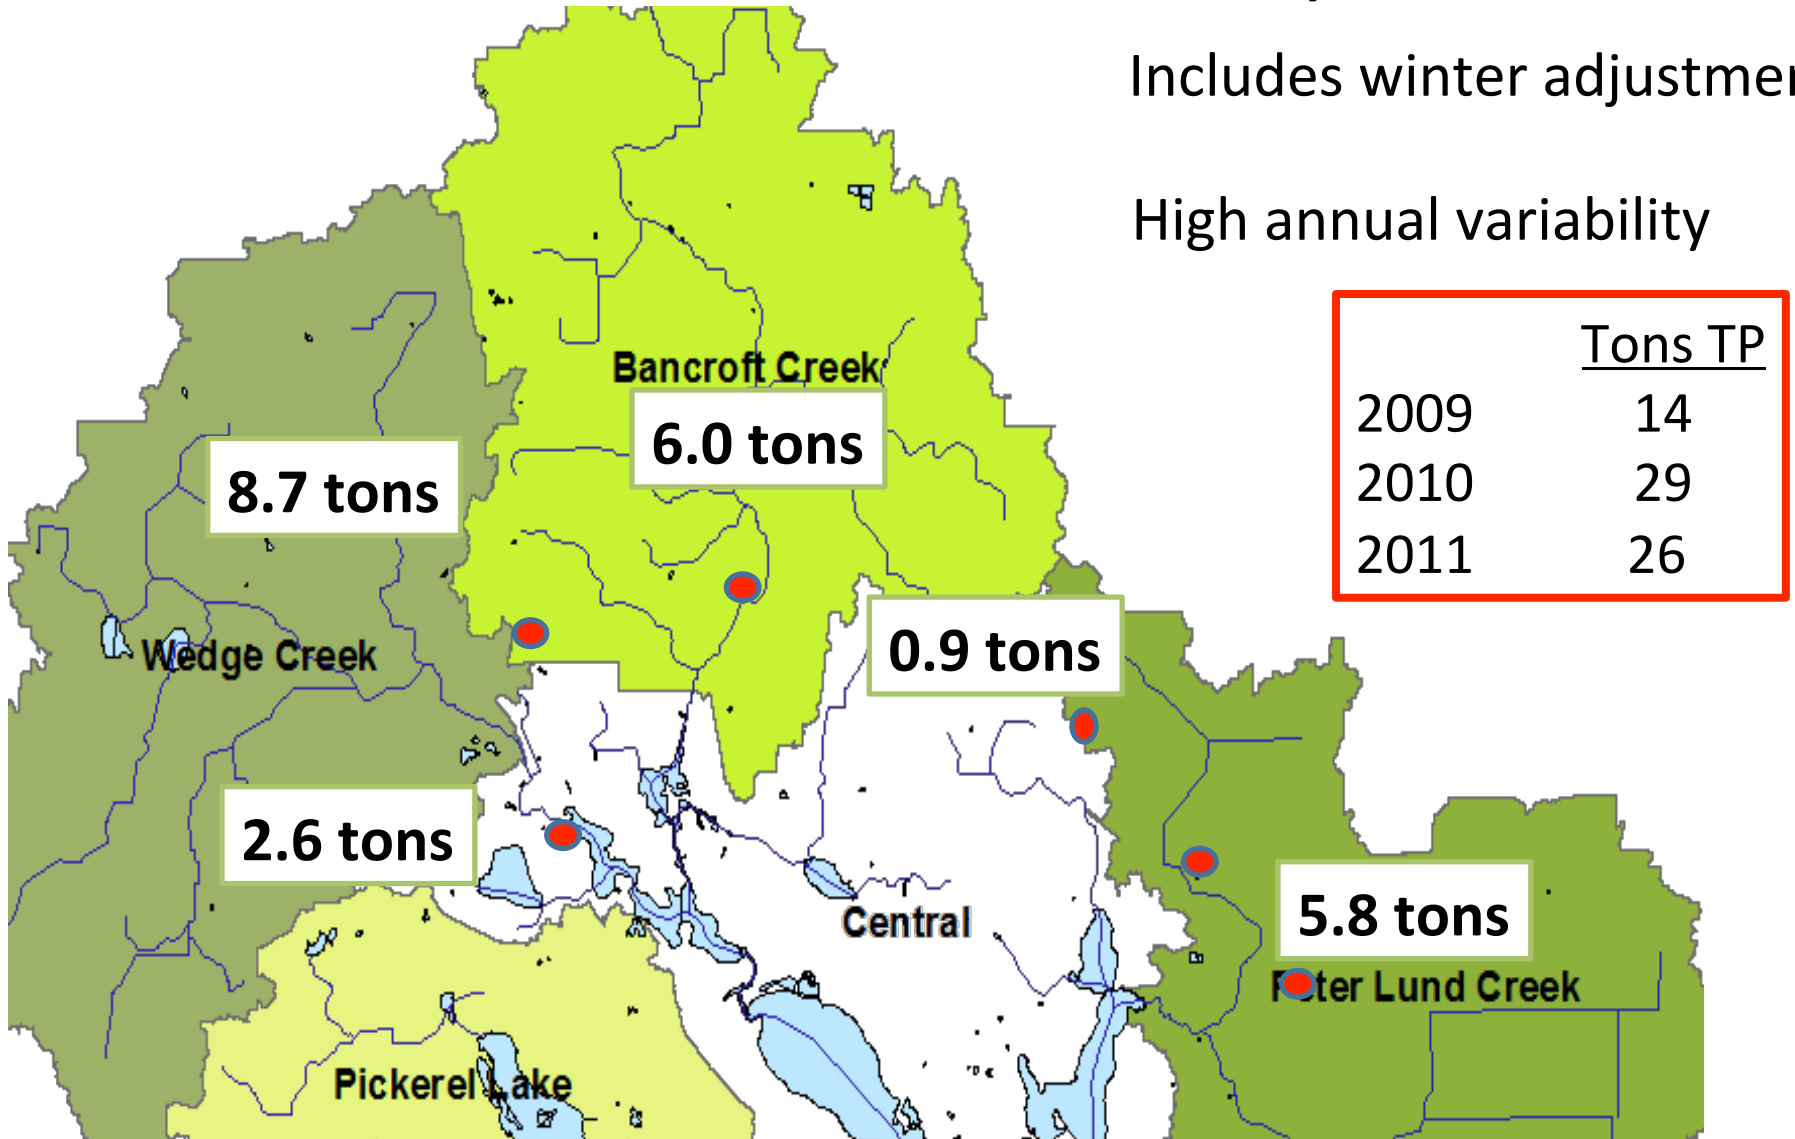

*\* Includes calves / piglets / poults imported into herd*

*We developed a spreadsheet calculator for each major animal system.*

# Average Annual Agricultural Stream P Loads, 2009-2011 = 24 tons/yr

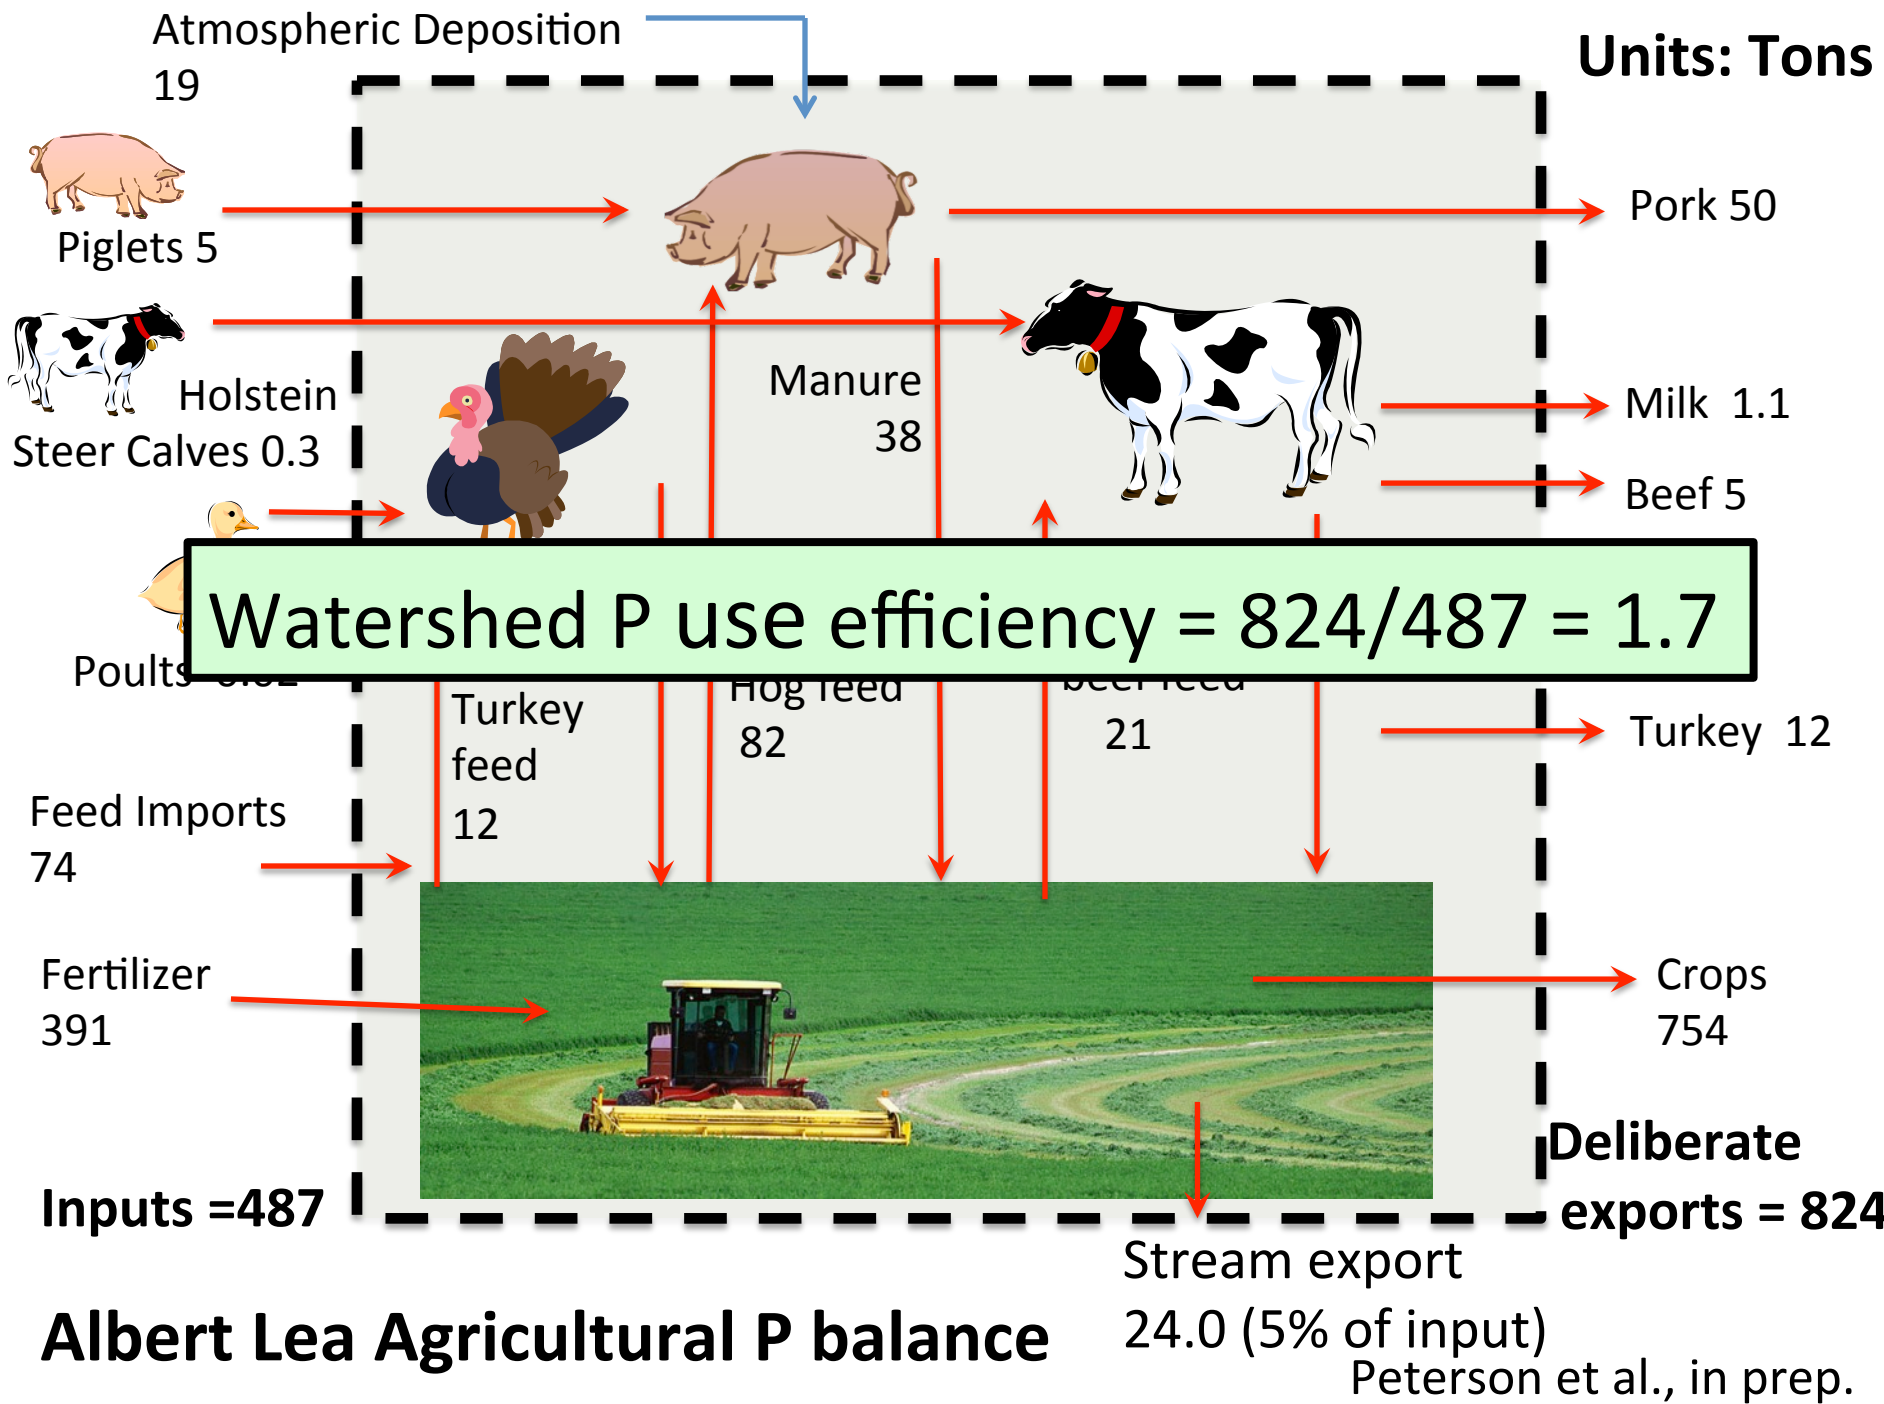

Includes winter adjustment

High annual variability

| Stream         | TP flux,<br>kg/yr | TP yield,<br>kg/ha-yr | Part. P,<br>% | Soluble<br>P, % | Water<br>yield,<br>cm/yr |

State-wide Ag P balance

## P balances for urban and agricultural components of Albert Lea watershed

|                 | P input, Gg/yr | Stream export, Gg/yr | % to stream |
|-----------------|----------------|----------------------|-------------|
| Wastewater      | 44             | 28                   | 64%         |
| Urban landscape | 2.0            | 0.8                  | 40%         |
| Agriculture     | 463            | 24                   | 5%          |

*Highest P inputs to agriculture, but agricultural runoff and urban wastewater contribute about the same to stream export.*

# Integration into Watershed Restoration and Protection (WRAP)?

## Summary

1. Watershed P balances can be a useful tool for nutrient management, especially to improve P use efficiency.
2. For the Albert Lea ag region, P use efficiency was  $> 100\%$  for 2010.
3. Spreadsheet calculator facilitates development of other whole-watershed P balances.
4. *Whole watershed P balance tool could be integrated into WRAP and TMDL processes.*

Next step: Identify opportunities to shift current P flow through system toward a circular P economy (NSF proposal in review).
